

3DUCATION

A custom website and webshop for your 3D-printing business — built to explain what you do, guide the right customer to the right place, and sell online.

Prepared for the 3DUCATION team · July 2026

What we set out to build

3DUCATION isn't just a shop — you serve very different people: schools looking for classroom solutions, families curious about 3D printing at home, and customers who need a repair. A plain webshop would treat them all the same and leave most of them confused about where to start.

So we built something closer to a **guided brochure with a shop attached**. The website's job is to quickly show a visitor which of your three services fits them, tell that story well, and then hand them off — to a quote request, a workshop booking, or the webshop. The shopping, cart and checkout are handled by WooCommerce, the industry-standard e-commerce engine, styled to match your brand.

The three pillars

Everything on the site is organised around three clear services. Each has its own colour, its own page, and its own path for the visitor — so nobody has to guess where they belong.

MAGENTA

3D-printen & webshop

Printers, filament and accessories — for schools (via education packages) and for home users (via the shop). Your commercial core.

CYAN

Workshops & educatie

Workshops, birthday parties and everything for schools. This is where the education story lives and where groups request a session.

AMBER

Service & montage

Repairs, maintenance and assembly. A clear checklist of what to prepare, plus a repair request form.

Supported by three more pages: the education packages in detail, an About page (with your team), and Contact.

The brand system & colours

The three-colour identity — **magenta, cyan and amber** — does real work, not just decoration. Each colour is tied to one pillar, so as visitors move through the site the colour quietly tells them which service they're looking at. Magenta is also your primary "action" colour: buttons and links across the whole site use it, so the next step is always obvious.

Magenta

Oplossingen & webshop · actions

Cyan

Workshops & educatie

Amber

Service & montage

Cube gradient

Signature accent

The three colours blend into the "cube" gradient — your signature flourish, used sparingly on hero moments. The typeface pairs a distinctive display font (Space Grotesk) for headlines with a clean, highly readable body font. There's also a matching audience split: anything aimed at schools leans cyan, anything for home leans magenta — reinforcing the same logic on the homepage.

Why this matters for you

The entire look is driven by a single design file, so the brand stays perfectly consistent everywhere and can be retuned centrally later without rebuilding pages. Add a product, write a page — it automatically inherits the right colours, spacing and type.

How a visitor moves through the site

The homepage is deliberately a short, guided journey rather than a wall of products:

- 1 **Hero** — an immediate, confident statement of who 3DUCATION is, over a full-bleed workshop photo.
- 2 **The three pillars** — a colour-coded split so visitors self-select their path in seconds.
- 3 **For schools vs. for home** — a two-way split (cyan for schools, magenta for home) for the two biggest audiences.
- 4 **Partners** — a moving strip of the brands you work with, for credibility.
- 5 **To the webshop** — a final nudge toward browsing and buying.

From there, each pillar page tells its story in depth and ends in a clear action — a quote, a booking, a repair request, or a product.

The webshop

The shop leads with a three-product spotlight you control, followed by clickable category chips (printers, filament, resin, accessories, workshops), then the full product grid. Shoppers can **search**, **sort** (A–Z, price, rating, newest) and **filter** by colour and type, and workshops are sold as products too — so a session booking goes through the same familiar cart and checkout as a spool of filament.

Working for you behind the scenes

- **Announcement bar** — post a temporary notice (changed opening hours, a promo) with an on/off switch and optional end date, no code needed.
- **Product spotlights** — pick the three products featured on the shop from a simple settings screen.
- **Search-engine basics** — each main page ships with a hand-written title and description so Google shows something sensible.
- **Dutch throughout** — the whole interface is in Dutch, in euros, for a Belgian audience.

Where the project stands

✓ Built & ready

- ✓ Full brand system & three-pillar site
- ✓ All pillar, education, about & contact pages
- ✓ Webshop, cart & checkout
- ✓ Announcement bar, spotlights, search, sorting & filters
- ✓ Photography in place across the site (stock stand-ins where your photos are pending)
- ✓ Mobile, tablet & desktop layouts

□ Before we go live

- Connect the three enquiry forms to email
- A little final copy (handover doc provided)
- Swap stock stand-ins for your real team & workshop photos
- Enter products, categories & prices
- Switch on the payment provider (e.g. Mollie)

The design and build are complete. What remains is content and configuration on the live site — the items above are tracked in a separate go-live checklist.

Next steps & timeline

A suggested path from here to launch. Timings are indicative — the pace really depends on how quickly the content (copy, product data and photos) comes together on your side.

PHASE	WHAT HAPPENS	OWNER	INDICATIVE
● 1 · Content & assets	You supply any final section copy (a short handover doc lists exactly what's needed), your product list with prices, and your real team & workshop photos to replace the stock stand-ins.	You	~1–2 weeks
● 2 · Build-out & wiring	We drop in your copy and photos, connect the three enquiry forms to email, load products and categories, and set up colour/type filters and spotlights.	Dev	~3–5 days
● 3 · Payments & review	Switch on the payment provider (e.g. Mollie), then review together: place test orders, check the site on phone/tablet/desktop, and proofread.	Dev You	~2–3 days
● 4 · Go live	Take the shop out of "coming soon", do a final checkout smoke-test on the live site, and announce it.	Dev	~1 day

Phases 1 and 2 can overlap — we can wire forms and structure while final copy is still being finalised. The critical path is your content in Phase 1.

What you can do yourselves

The site is built on WordPress + WooCommerce, so day-to-day running is in your hands:

- **Products & prices** — add, edit and stock products, including workshop sessions, from the WooCommerce dashboard.
- **The announcement bar & spotlights** — change from a simple settings page.
- **Categories & descriptions** — write category text and set a thumbnail image.
- **Structure & design** — the page layouts and brand are part of the theme; changes there come back to us, keeping everything consistent.

In short

You have a brand-led website that guides three very different audiences to the right place, a webshop that handles products and workshop bookings alike, and a set of simple controls for the things you'll change often. The remaining work is filling it with your real content and switching on payments.

Technical appendix

For your developer or anyone maintaining the theme. The full working reference lives in `CLAUDE.md` (architecture) and `GO-LIVE.md` (launch steps) in the theme repository.

Platform

Type	Custom WooCommerce block theme (Full Site Editing), no build step
Design source	<code>theme.json</code> (v3) — fully tokenized palette, type & spacing; drives the whole look
Supplementary CSS	<code>assets/custom.css</code> — only what tokens can't express (bento grid, partner marquee, hover physics, notice bar, photo hero)
Logic	<code>functions.php</code> — theme wiring + site-notice bar, product spotlights, per-pillar SEO, catalog sorting, add-to-cart labels, product visibility windows
Hosting	EasyHost Managed WordPress · deploy via SFTP into <code>wp-content/themes/3ducation/</code>
Local dev	<code>@wordpress/env</code> (Docker), Node 22 LTS
Cache-busting	<code>THREEDUCATION_VERSION</code> in <code>style.css</code> / <code>functions.php</code> — bump on each release; doubles as the asset cache-buster

Structure

Templates	front-page, index, page, single, search, 404; archive-product, single-product, product-search-results; page-cart, page-checkout; and pillar pages: oplossingen, workshops, service, educatieve-pakketten, over-ons, contact
Parts	header, footer
Patterns (35)	Reusable block sections registered to the <code>3ducation</code> category; some render live data (spotlights, category chips)

Content & WooCommerce notes

- Categories: printers, filament, resin, accessories, workshops.
- Shop filters use `kleur` and `type` product attributes — must be created and assigned to products on the live site.
- Workshop sessions are products (sold via the shop's Workshops category); a `_visible_until` date hides expired sessions from the catalog.
- Birthday-party bookings run through the **LatePoint** plugin (booking → WooCommerce cart → Mollie); the "Reserveer je feestje" button already hooks into it, with a `mailto:` fallback until it's installed.
- Per-product option selectors (e.g. the printer workshop's build/mounted/+workshop choices) use the WooCommerce Product Add-Ons plugin; a few of its UI strings need Dutch translation via Loco Translate.
- Category descriptions support Markdown + a thumbnail image.

Before go-live (developer)

- Wire the three intake forms (currently `action="#"`) to a form handler or email.
- Swap stock stand-in photos (team portraits, "Uit de praktijk" gallery) for real 3DUCATION images.
- Create live Pages for each nav slug and assign the matching template, or nav links 404.
- Set `woocommerce_coming_soon` to `no`; enter catalog; pick spotlights; configure the payment gateway; install LatePoint + WooCommerce Product Add-Ons.
- After any `patterns/*.php` change, flush the pattern cache (separate from the object cache).

Deferred / optional: a dedicated SEO plugin (replacing the hand-written per-pillar SEO), and moving workshop scheduling to LatePoint too if the product-based session model outgrows itself.
